Inverse polymerase chain reaction (iPCR) is a powerful tool that can be used for the sequence analysis of DNA when only one end of a DNA sequence is known. iPCR1-3 amplies DNA from a circular template using primers with their 3? ends directed away from each other (Figure 21.1). Cloning and sequencing PCR products are facilitated by the use of vectors, for example, pCR82.1 (Invitrogen), which contain a thymine overhang. iPCR is very useful for supplementing conventional PCR screens that ...
